The compounds of the formula I which are basic in nature are capable of forming a wide variety of different salts with various inorganic and organic acids. Although such salts must be pharmaceutically acceptable for administration to animals, it is often desirable in practice to initially isolate a compound of the formula I from the reaction mixture as a pharmaceutically unacceptable salt and then simply convert the latter back to the free base compound by treatment with an alkaline reagent, and subsequently convert the free base to a pharmaceutically

acceptable acid addition salt. The acid addition salts of the base compounds of this invention are readily prepared by treating the base compound with a substantially equivalent amount of the chosen mineral or organic acid in an aqueous solvent medium or in a suitable organic solvent such as methanol or ethanol. Upon careful evaporation of the solvent, the desired solid salt is obtained.

The acids which are used to prepare the pharmaceutically acceptable acid addition salts of the base compounds of this invention are those which form non-toxic acid addition salts, i.e., salts containing pharmacologically acceptable anions, such as hydrochloride, hydrobromide, hydroiodide, nitrate, sulfate or bisulfate, phosphate or acid phosphate, acetate, lactate, citrate or acid citrate, tartrate or bitartrate, succinate, maleate, fumarate, gluconate, saccharate, benzoate, methanesulfonate and pamoate [i.e., 1,1'-methylene-bis-(2-hydroxy-3-naphthoate)] salts.

Those compounds of the formula I which are also acidic in nature, e.g., where R_2 contains a carboxylate, are capable of forming base salts with various pharmacologically acceptable cations. Examples of such salts include the alkali metal or alkaline-earth metal salts and particularly, the sodium and potassium salts. These salts are all prepared by conventional techniques. The chemical bases which are used as reagents to prepare the pharmaceutically acceptable base salts of this invention are those which form non-toxic base salts with the herein described acidic compounds of formula I. These non-toxic base salts include those derived from such pharmacologically acceptable cations as sodium, potassium calcium and magnesium, etc. These salts can easily be prepared by treating the corresponding acidic compounds with an aqueous solution containing the desired pharmacologically acceptable cations, and then evaporating the resulting solution to dryness, preferably under reduced pressure. Alternatively, they may also be

prepared by mixing lower alkanolic solutions of the acidic compounds and the desired alkali metal alkoxide together, and then evaporating the resulting solution to dryness in the same manner as before. In either case, stoichiometric quantities of reagents are preferably employed in order to ensure completeness of reaction of maximum product of yields of the desired final product.

The compounds of the formula I and the pharmaceutically acceptable salts thereof (hereinafter, also referred to as the active compounds of the invention) are useful psychotherapeutics and are potent serotonin (5-HT_1) agonists and may be used in the treatment of depression, anxiety, eating disorders, obesity, drug abuse, cluster headache, migraine, chronic paroxysmal hemicrania and headache associated with vascular disorders, pain, and other disorders arising from deficient serotonergic neurotransmission. The compounds can also be used as centrally acting antihypertensives and vasodilators.

The active compounds of the invention are evaluated as anti-migraine agents by testing the extent to which they mimic sumatriptan in contracting the dog isolated saphenous vein strip (P.P.A. Humphrey et al., Br. J. Pharmacol., 94, 1128 (1988)). This effect can be blocked by methiothepin, a known serotonin antagonist. Sumatriptan is known to be useful in the treatment of migraine and produces a selective increase in carotid vascular resistance in the anaesthetized dog. It has been suggested (W. Fenwick et al., Br. J. Pharmacol., 96, 83 (1989)) that this is the basis of its efficacy.

The compositions of the present invention may be formulated in a conventional manner using one or more pharmaceutically acceptable carriers. Thus, the active compounds of the invention may be formulated for oral, buccal, intranasal, parenteral (e.g., intravenous, intramuscular or subcutaneous) or rectal administration or

in a form suitable for administration by inhalation or insufflation.

For oral administration, the pharmaceutical compositions may take the form of, for example, tablets or capsules prepared by conventional means with pharmaceutically acceptable excipients such as binding agents (e.g. pregelatinised maize starch, polyvinylpyrrolidone or hydroxypropyl methylcellulose); fillers (e.g. lactose, microcrystalline cellulose or calcium phosphate); lubricants (e.g. magnesium stearate, talc or silica); disintegrants (e.g. potato starch or sodium starch glycollate); or wetting agents (e.g. sodium lauryl sulphate). The tablets may be coated by methods well known in the art. Liquid preparations for oral administration may take the form of, for example, solutions, syrups or suspensions, or they may be presented as a dry product for constitution with water or other suitable vehicle before use. Such liquid preparations may be prepared by conventional means with pharmaceutically acceptable additives such as suspending agents (e.g. sorbitol syrup, methyl cellulose or hydrogenated edible fats); emulsifying agents (e.g. lecithin or acacia); non-aqueous vehicles (e.g. almond oil, oily esters or ethyl alcohol); and preservatives (e.g. methyl or propyl p-hydroxybenzoates or sorbic acid).

For buccal administration the composition may take the form of tablets or lozenges formulated in conventional manner.

The active compounds of the invention may be formulated for parenteral administration by injection, including using conventional catheterization techniques or infusion. Formulations for injection may be presented in unit dosage form e.g. in ampules or in multi-dose containers, with an added preservative. The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulating agents such as suspending, stabilizing and/or dispersing agents.

Alternatively, the active ingredient may be in powder form for reconstitution with a suitable vehicle, e.g. sterile pyrogen-free water, before use.

The active compounds of the invention may also be formulated in rectal compositions such as suppositories or retention enemas, e.g., containing conventional suppository bases such as cocoa butter or other glycerides.

For intranasal administration or administration by inhalation, the active compounds of the invention are conveniently delivered in the form of a solution or suspension from a pump spray container that is squeezed or pumped by the patient or as an aerosol spray presentation from a pressurized container or a nebulizer, with the use of a suitable propellant, e.g. dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, carbon dioxide or other suitable gas. In the case of a pressurized aerosol, the dosage unit may be determined by providing a valve to deliver a metered amount. The pressurized container or nebulizer may contain a solution or suspension of the active compound. Capsules and cartridges (made, for example, from gelatin) for use in an inhaler or insufflator may be formulated containing a powder mix of a compound of the invention and a suitable powder base such as lactose or starch.

A proposed dose of the active compounds of the invention for oral, parenteral or buccal administration to the average adult human for the treatment of the conditions referred to above (e.g., migraine) is 0.1 to 200 mg of the active ingredient per unit dose which could be administered, for example, 1 to 4 times per day.

Aerosol formulations for treatment of the conditions referred to above (e.g., migraine) in the average adult human are preferably arranged so that each metered dose or "puff" of aerosol contains 20 μg to 1000 μg of the compound of the invention. The overall daily dose with an aerosol will be within the range 100 μg to 10 mg. Administration

may be several times daily, for example 2, 3, 4 or 8 times, giving for example, 1, 2 or 3 doses each time.

The following Examples illustrate the preparation of the compounds of the present invention. Melting points are uncorrected. NMR data are reported in parts per million (δ) and are referenced to the deuterium lock signal from the sample solvent. Specific rotations were measured at room temperature using the sodium D line (589 nm).

Commercial reagents were utilized without further purification. Chromatography refers to column chromatography performed using 32-63 μm silica gel and executed under nitrogen pressure (flash chromatography) conditions. Room temperature refers to 20 - 25°C.

A solution of 5-(2-sulfonylethenyl)-3-(N-methylpyrrolidin-2-yl)-1H-indole (0.47 mmol) and 10% Pd/C (0.150 g) in ethanolic hydrogen chloride [prepared from absolute ethanol (10 mL) and acetyl chloride (43 μL)] and N, N-dimethylformamide (7.5 mL) was shaken under a hydrogen atmosphere (15 psi) at room temperature for 20 hours. Two solutions containing the reactants were prepared separately as follows. To a stirred solution of N-carbobenzyloxyproline (D or L, 3.10 g, 12.4 mmol, 1 eq) or N-carbobenzyloxyazetidine-2-carboxylic acid (R or S or racemate, 12.4 mmol) or N-carbobenzyloxypipecolinic acid (R or S or racemate, 12.4 mmol) in anhydrous methylene chloride (7 mL) with one drop dimethylformamide was added oxalyl chloride (1.60 mL, 18.4 mmol, 1.5 eq), and the resulting effervescing solution was stirred at room temperature under nitrogen for 1.5 hours. The solution was then evaporated under reduced pressure, and any remaining solvent was removed from the residual oil using high vacuum to afford the N-benzyloxycarbonylproline acid chloride. At the same time, a solution of ethylmagnesium bromide (3.0 M in ether,

4.13 mL, 12.4 mmol, 1 eq) was added to a stirred solution of the indole (12.4 mmol) in anhydrous ether (50 mL), and this cloudy solution was heated at reflux under nitrogen for 1.5 hours to form the indolemagnesium bromide salt. The proline acid chloride was then dissolved in methylene chloride or ethyl ether (3 mL), and this solution was added dropwise to the stirred solution of the indolemagnesium bromide salt at room temperature, and the resultant reaction mixture was stirred at room temperature under nitrogen for 1 hour. A saturated solution of sodium hydrogen carbonate (25 mL) and ethyl acetate (50 mL) was then added to the reaction mixture, and this mixture was vigorously stirred for 15 minutes. The resulting mixture was filtered through diatomaceous earth (Celite (trademark)), the solids washed with copious amounts of ethyl acetate, and the ethyl acetate layer was separated from the aqueous layer which was extracted with ethyl acetate (2 x 25 mL). All ethyl acetate extracts were combined, dried, and evaporated under reduced pressure. EXAMPLE 22

General Procedure for Hydrogenation of 5-alkenylindoles

A typical procedure is as follows:

A. (R)-5-(2-Aminosulphonylethyl)-3-(N-methyl-pyrrolidin-2-ylmethyl)-1H-indole

(R)-5-(2-Aminosulphonylethenyl)-3-(N-methyl-pyrrolidin-2-ylmethyl)-1H-indole (157 mg, 0.5 mmol) was dissolved in absolute ethanol (10 mL) and added to a solution of ethanolic hydrogen chloride 25 ml (prepared from acetyl chloride (38 μL, 0.53 mmol) and absolute ethanol (25 mL)). 10% palladium-on-carbon (125 mg) was added. This solution was hydrogenated under a hydrogen atmosphere (15 p.s.i.) at room temperature for 18 hours. The resultant reaction mixture was filtered through diatomaceous earth (Celite trademark or Arbacell-trademark)) washed with absolute ethanol and the combined filtrates evaporated in vacuo. The residue was purified by column chromatography on silica gel, eluting with a gradient solvent mixture up to CH_2Cl_2: MeOH:NH_4OH 93:7:1 to give the title compound as a colourless oil (80 mg, 51%).
